

Software Quality Assurance Test Report

1. Executive Summary

This report presents the quality assurance test findings across functional and non-functional requirements for the TAPGO onboarding and contract platform. Based on the evaluation, the frontend user interface elements are mostly present, but the application is currently blocked by a **critical lack of backend infrastructure**. Core workflows—including contract generation, localization, data validation, secure storage, and email notifications—are completely non-functional or missing required backend logic.

2. Test Results by Section

4.1 Language & Localisation

ID	Prio	Requirement	Status	Finding
L-01	Must	Language selector must be the first interaction before any form fields	Pass	Landing page shows language picker before the "Start onboarding" button. Correct.
L-02	Must	All UI labels, buttons, errors translated into DE, FR, EN, TR, IT	Partial	5 languages are listed and selectable. However the entire visible UI remains in English regardless of selection — no language switch actually re-renders text. Translation layer is not wired up.
L-03	Must	Both generated contract documents available in all 5 languages	Fail	No contract documents are generated at all (Step 3 shows placeholder cards). Language-specific templates are absent.
L-04	Must	Language selection must be	Partial	The top bar shows the selected flag/language label between steps. However since no actual

		persist across all steps in the session		translation renders, persistence cannot be verified end-to-end.
L-05	Should	Confirmation email to customer must be in selected language	Fail	No emails are sent (submission is non-functional), so language-matched email is unverifiable and presumed absent.

4.2 Onboarding Form

ID	Prio	Requirement	Status	Finding
F-01	Must	All required fields from §3 must be present	Partial	Most fields present (company, address, restaurant, contact, email, phone, kiosks, printers). Missing: dedicated <i>Number of POS</i> input (POS is hardcoded to 1, not user-editable as §3 implies), and <i>Stripe Terminals qty</i> is auto-calculated rather than shown as an informational field the user can verify.
F-02	Must	System must validate all required fields before allowing progression to Step 2	Fail	All Step 2 fields (company name, address, restaurant name, contact, email, phone) can be left blank and "Review contract" still advances to Step 3. No validation fires.
F-03	Must	Monthly price computed in real-time as quantities change	Pass	Sidebar and in-step pricing updates immediately when kiosk quantity changes. POS is fixed at 49 CHF/mo. Totals update correctly.
F-04	Should	Printer count defaults to	Partial	Printer counter is shown and editable in Step 2. However it does not dynamically

		(Kiosks + POS), manually editable		re-sync when kiosk count is changed on Step 1 after already visiting Step 2 — state goes stale on back-navigation.
F-05	Must	Form must be mobile-responsive and usable on smartphones	Partial	Viewport meta tag is set correctly. Layout appears responsive in markup. However the side summary panel and some grid elements likely overflow on narrow screens — full mobile QA is needed.
F-06	Must	Progress indicator (Step X of 4) must be shown at all times	Pass	Progress bar with numbered steps and "Step X of 4" label is visible throughout all steps.

4.3 Contract Generation & Signature

ID	Prio	Requirement	Status	Finding
C-01	Must	System must populate customer data into both contract templates	Fail	No contract generation occurs. Step 3 shows two static placeholder cards ("TapGo / Preview" and "TapGo / Phase 1") with no customer data merged in.
C-02	Must	Generated contracts must be available for preview before signing	Fail	"Download contract preview" button does nothing. No PDF is rendered in-browser. Preview is entirely absent.
C-03	Must	Contract start date field must remain blank (filled	N/A	Cannot verify — no contract is generated. The UI correctly notes "This remains blank in the generated documents" but the document itself doesn't exist yet.

		on installation day)		
C-04	Must	Must support at least one electronic signature method	Partial	A canvas-based draw-signature widget is present and functional as a UI element. However it is not linked to any signing backend, is not validated before progression, and produces no signed artifact.
C-05	Must	Signed contracts must be stored securely linked to submission record	Fail	No backend storage exists. Submission produces no server-side record.
C-06	Must	System must prevent progression to Step 3 without completed signature	Fail	Step 3's "Continue to submission" button is not blocked when the canvas is blank and both checkboxes are unticked. Users can skip the signature entirely.
C-07	Must	Avenant must override commercial terms per contract hierarchy in §8	Fail	Not implementable without actual contract generation. No document hierarchy logic exists.

4.4 Menu Upload

ID	Prio	Requirement	Status	Finding
M-01	Must	Upload interface must	Pass	Accepted formats label correctly lists all 5 types. File picker UI is present.

		accept PDF, JPG, PNG, XLSX, DOCX		
M-02	Must	Must support uploading multiple files simultaneously	Pass	Drop zone and file chooser support multiple files. Max 10 files shown.
M-03	Must	Enforce 20 MB per-file limit and 10-file maximum	Partial	Limits are correctly displayed in the UI (20 MB / 10 files). Whether they are actually enforced on the client or server side cannot be confirmed — no backend exists to reject oversized files.
M-04	Should	Optional text note field for special menu instructions	Pass	"Menu note" / Special instructions textarea is present in Step 4.
M-05	Must	Uploaded files must be included as attachments in notification email to TAPGO	Fail	No email is sent on submission. Files are not transmitted anywhere.

4.5 Submission & Notifications

ID	Prio	Requirement	Status	Finding
N-01	Must	On submission, send email to contract@tapgo.ch with attachments + customer summary	Fail	No email is sent. The success screen states the package is "prepared for delivery" — this is inaccurate. No backend email service is wired up.
N-02	Must	Customer must receive confirmation	Fail	No customer email is sent. No contract PDF exists to attach.

		email with signed contract attached		
N-03	Must	System must display a clear success/confirmation screen after submission	Pass	A success screen with checkmark, reference, and next-steps copy is shown. The screen itself is present and clear.
N-04	Should	Submission data stored in backend database for Phase 2 portal	Fail	No backend database. Submission data exists only in the browser session and is lost on close.

5. Non-Functional Requirements

ID	Prio	Requirement	Status	Finding
NF-01	Must	Accessible via Chrome, Safari, Firefox, Edge on desktop & mobile	Pass	Standard HTML/JS app with correct viewport meta. No browser-specific APIs detected. Should work cross-browser.
NF-02	Should	Page load under 3 seconds on 4G mobile	N/A	Cannot be performance-tested from this context. Markup is lean; likely acceptable but unverified.
NF-03	Must	All data in transit encrypted via HTTPS (TLS 1.2+)	Pass	Site is served over HTTPS. TLS configuration assumed correct for a hosted domain.
NF-04	Must	Comply with Swiss LPD and GDPR	Fail	No privacy notice, cookie banner, data processing consent, or data retention disclosure is shown anywhere in the flow. Collecting personal data (name, email, address) without these is non-compliant.

NF-05	Must	Customer data not retained beyond legal necessity without explicit consent	N/A	No backend storage exists, so no retention occurs — but this is only safe by accident. Must be addressed when backend is added.
NF-08	Must	Uploaded files and generated contracts stored securely with access controls	Fail	No cloud storage bucket or access-controlled file storage exists. Files remain only in the browser's memory.

3. §8 Open Questions — Impact on Current Build

The following architectural and business decisions are pending and directly impact development:

- **Q1: Which e-signature solution? (Scribble / Dropbox Sign / download+upload) [Critical]**
 - *Impact:* The site currently implements a simple canvas drawing widget that is none of the three options listed. A definitive decision is required; the current widget has no legal validity and its output is not stored anywhere.
- **Q2: Should the system assign a unique reference number per submission? [Critical]**
 - *Impact:* Currently hardcoded as "TG-0000" for every user. If the answer is yes (almost certainly), this constitutes a blocking issue for system tracking.
- **Q7: Is the menu upload step mandatory or skippable? [Medium]**
 - *Impact:* The site currently states "a menu file or link is required" but does not enforce it. A finalized decision is needed before validation logic can be implemented.
- **Q3/Q4: Domain / URL + link expiry for unique onboarding links [Medium]**
 - *Impact:* The application is currently hosted on contract.tapgo.ch, whereas the SRD suggested onboard.tapgo.ch. Unique reference-parameter links and link expiry logic are completely absent.
- **Q8: Should a CC email be sent to the contact person at submission? [Low]**
 - *Impact:* Not implemented (as no emails are sent at all). This must be resolved alongside the implementation of requirements N-01 and N-02.
